

Truss Jibs

Truss Jib - A truss jib is utilized to carry and position trusses. It is actually an extended jib additional part which is equipped along with a pyramid or triangular shaped frame. Normally, truss jibs are mounted on machinery like for instance a compact telehandler, a skid steer loader or even a forklift utilizing a quick-coupler attachment.

Older style cranes which have deep triangular truss jibs are normally assemble and fastened with bolts and rivets into standard open structural shapes. There are seldom any welds on these style jibs. Each and every riveted or bolted joint is prone to rust and thus requires frequent maintenance and inspection.

Truss jibs are designed with a back-to-back collection of lacing members separated by the width of the flange thickness of an additional structural member. This particular design could cause narrow separation between the flat surfaces of the lacings. There is limited access and little room to clean and preserve them against rusting. Numerous rivets become loose and rust inside their bores and should be replaced.
